1 Main Page

covaree is a C++ template library for local polynomial regression of covariates in state-space models. The covaree library is based on the [Eigen](#) library for linear algebra, and includes several modules:

- The [Core module](#) which provides the base functionality for local polynomial regression
- The [Tree module](#) which provides a search tree approximation to local polynomial regression
- The [Interpolate module](#) which provides classes for cubic interpolation in 1-3 dimensions
- The [JAGS module](#), which provides a module for using covaree with [JAGS](#)
- The [TMB module](#) which provides functionality to use covaree with [TMB](#).

The Core module

The Core module provides the class [covaree](#) for local polynomial regression.

Local polynomial regression

For simplicity, consider the univariate model

$$y_i = g(x_i) + \epsilon_i$$

where $g : \mathbb{R} \mapsto \mathbb{R}$ is a smooth function and $\epsilon_i \sim N(0, \sigma^2)$. To do local polynomial regression of g at x_0 , we do a Taylor expansion of order p ,

$$g(x) \approx g(x_0) + g^{(1)}(x_0)(x - x_0) + \frac{1}{2!}g^{(2)}(x_0)(x - x_0)^2 + \cdots + \frac{1}{p!}g^{(p)}(x_0)(x - x_0)^p$$

Substituting into the original model,

$$y_i = g(x_0) + g^{(1)}(x_0)(x - x_0) + \frac{1}{2!}g^{(2)}(x_0)(x - x_0)^2 + \cdots + \frac{1}{p!}g^{(p)}(x_0)(x - x_0)^p + \epsilon_i$$

we obtain a linear model with coefficients $\theta = (g(x_0), g^{(1)}(x_0), g^{(2)}(x_0), \dots, g^{(p)}(x_0))^T$, observations $\mathbf{Y} = (y_1, y_2, \dots, y_n)^T$, and the design matrix

$$\mathbf{X} = \begin{pmatrix} 1 & (x_1 - x_0) & \frac{1}{2!}(x_1 - x_0)^2 & \cdots & \frac{1}{p!}(x_1 - x_0)^p \\ 1 & (x_2 - x_0) & \frac{1}{2!}(x_2 - x_0)^2 & \cdots & \frac{1}{p!}(x_2 - x_0)^p \\ \vdots & \vdots & \vdots & & \vdots \\ 1 & (x_n - x_0) & \frac{1}{2!}(x_n - x_0)^2 & \cdots & \frac{1}{p!}(x_n - x_0)^p \end{pmatrix}$$

As we are interested in a local estimate, observations are weighed by their distance to x_0 . The weights form the diagonal matrix \mathbf{W} with

$$w_{ii} = \det(H^{-1}) (1 - \|H^{-1} \cdot (x_i - x_0)\|^2) \vee 0$$

Now the estimates are obtained by

$$\hat{\theta} = (\mathbf{X}^T \mathbf{W} \mathbf{X})^{-1} \mathbf{X}^T \mathbf{W} \mathbf{Y}$$

giving both the estimated function value at x_0 and estimates of the first p derivatives.

The Interpolate module

Cubic interpolation

The Tree module

Search Tree

Approximation to local polynomial regression

The JAGS and TMB modules

The JAGS and TMB modules...

JAGS example

```
model {
  cf <- covafill(x, obsC, obs, h, 2.0)
  sigma ~ dunif(0, 100)
  tau <- pow(sigma, -2)
  for(i in 1:N) {
    y[i] ~ dnorm(cf[i], tau)
  }
}
```

TMB example

```
#include <TMB.hpp>
#include <covafill/TMB>

template<class Type>
Type objective_function<Type>::operator() ()
{
  DATA_MATRIX(obs);
  DATA_MATRIX(coord);
  DATA_VECTOR(covObs);
  DATA_INTEGER(p);
  DATA_VECTOR(h);

  PARAMETER(logObsSd);
  PARAMETER(logObsTSd);
  PARAMETER(logStatSd);
  PARAMETER_MATRIX(x);

  Type nll = 0.0;
  covafill<Type> cf(coord, covObs, h, p);

  // Contribution from states
  for(int i = 1; i < x.cols(); ++i){
    nll -= dnorm(x(0, i), x(0, i-1), exp(logStatSd), true);
    nll -= dnorm(x(1, i), x(1, i-1), exp(logStatSd), true);
  }
}
```

```
// contribution from observations
for(int i = 0; i < obs.cols(); ++i){
  nll -= dnorm(obs(0,i), x(0,i), exp(logObsSd),true);
  nll -= dnorm(obs(1,i), x(1,i), exp(logObsSd),true);
  vector<Type> tmp = x.col(i);
  Type val = evalFill((CppAD::vector<Type>)tmp, cf)[0];
  nll -= dnorm(obs(2,i), val, exp(logObsTSd),true);
}

return nll;
}
```

2 Module Index

2.1 Modules

Here is a list of all modules:

Core module	5
Interpolation module	6
JAGS module	7
TMB module	8
Tree module	10

3 Hierarchical Index

3.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

<code>ncubicInterpolation< scalar_type ></code>	19

4 Class Index

4.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

<code>atomicEvalFill< Type ></code>	
CppAD atomic class to use estimated derivatives in automatic differentiation. See CppAD↔ ::atomic_base for further documentation	11
<code>atomicEvalTree< Type ></code>	
CppAD atomic class to use estimated derivatives in automatic differentiation. See CppAD↔ ::atomic_base for further documentation	12
<code>bicubicInterpolation< scalar_type_ ></code>	
Class for bi-cubic interpolation of local polynomial regression on a square	13
<code>covafill< scalar_type_ ></code>	
Class to do local polynomial regression	14
<code>jags::covafillJAGS::covafillJAGS</code>	
Class that defines the covafill function for local polynomial regression to be used in a JAGS model	15
<code>jags::covafillJAGS::covafillModule</code>	
Class that defines a JAGS Module for local polynomial regression	17
<code>covanode< scalar_type_ ></code>	
Class that defines nodes of a covatree	17
<code>covatree< scalar_type_ ></code>	
Class that defines a covatree for search tree approximated local polynomial regression	18
<code>cubicInterpolation< scalar_type_ ></code>	
Class for cubic interpolation in dimension 1-3 of local polynomial regression on a square	19
<code>ncubicInterpolation< scalar_type_ ></code>	
Class for n-cubic interpolation (n = 1,2,3) of local polynomial regression on a square. The class should not be used as anything but a common parent for the dimension specific interpolation classes	19
<code>tricubicInterpolation< scalar_type_ ></code>	
Class for tri-cubic interpolation of local polynomial regression on a square	20
<code>unicubicInterpolation< scalar_type_ ></code>	
Class for cubic interpolation of local polynomial regression on a square	22

5 Module Documentation

5.1 Core module

Classes

- class `covafill< scalar_type_ >`
Class to do local polynomial regression.

5.1.1 Detailed Description

The Core module of covafill provides a class for local polynomial regression.

```
#include <covafill/Core>
```

5.2 Interpolation module

Classes

- class [bicubicInterpolation< scalar_type_ >](#)
Class for bi-cubic interpolation of local polynomial regression on a square.
- class [cubicInterpolation< scalar_type_ >](#)
Class for cubic interpolation in dimension 1-3 of local polynomial regression on a square.
- class [ncubicInterpolation< scalar_type_ >](#)
Class for n-cubic interpolation ($n = 1, 2, 3$) of local polynomial regression on a square. The class should not be used as anything but a common parent for the dimension specific interpolation classes.
- class [tricubicInterpolation< scalar_type_ >](#)
Class for tri-cubic interpolation of local polynomial regression on a square.
- class [unicubicInterpolation< scalar_type_ >](#)
Class for cubic interpolation of local polynomial regression on a square.

5.2.1 Detailed Description

The Interpolate module of covafill provides classes for cubic interpolation in 1-3 dimensions. The class serves as a common wrapper for the dimension specific interpolation classes.

```
#include <covafill/Interpolate>
```

5.3 JAGS module

Classes

- class [jags::covafillJAGS::covafillModule](#)
Class that defines a JAGS Module for local polynomial regression.
- class [jags::covafillJAGS::covafillJAGS](#)
Class that defines the covafill function for local polynomial regression to be used in a JAGS model.

5.3.1 Detailed Description

The JAGS module defines a JAGS module to use the function covafill for local polynomial regression in a JAGS model.

```
#include <covafill/JAGS>
```

5.4 TMB module

Classes

- class [atomicEvalFill< Type >](#)

CppAD atomic class to use estimated derivatives in automatic differentiation. See [CppAD::atomic_base](#) for further documentation.

- class [atomicEvalTree< Type >](#)

CppAD atomic class to use estimated derivatives in automatic differentiation. See [CppAD::atomic_base](#) for further documentation.

Functions

- `CppAD::vector< double > evalFill (CppAD::vector< double > tx, const covafill< double > &cf) CSKIP(`
Evaluates a covafill object, cf, at the coordinates tx.
- `template<class Type >`
`CppAD::vector< Type > evalFill (CppAD::vector< Type > tx, const covafill< AD< Type > > &cf)`
- `template<class Type >`
`CppAD::vector< AD< Type > > evalFill (CppAD::vector< AD< Type > > tx, covafill< AD< Type > > cf)`
- `CppAD::vector< double > evalTree (CppAD::vector< double > tx, const covatree< double > &ct) CSKIP(`
Evaluates a covatree object, ct, at the coordinates tx.
- `template<class Type >`
`CppAD::vector< Type > evalTree (CppAD::vector< Type > tx, const covatree< AD< Type > > &ct)`
- `template<class Type >`
`CppAD::vector< AD< Type > > evalTree (CppAD::vector< AD< Type > > tx, covatree< AD< Type > > ct)`

5.4.1 Detailed Description

The TMB module of covafill provides functions to evaluate a covafill or covatree object from a TMB model such that the estimated gradients are used in the automatic differentiation.

```
#include <covafill/TMB>
```

5.4.2 Function Documentation

5.4.2.1 `template<class Type > CppAD::vector<Type> evalFill (CppAD::vector< Type > tx, const covafill< AD< Type > > & cf)`

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

5.4.2.2 `template<class Type > CppAD::vector<AD<Type > > evalFill (CppAD::vector< AD< Type > > tx, covafill< AD< Type > > cf)`

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

5.4.2.3 `template<class Type > CppAD::vector<Type> evalTree (CppAD::vector< Type > tx, const covatree< AD< Type > > & ct)`

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

```
5.4.2.4  template<class Type > CppAD::vector<AD<Type > > evalTree ( CppAD::vector< AD< Type > > tx, covatree<
        AD< Type > > ct )
```

This is an overloaded member function, provided for convenience. It differs from the above function only in what argument(s) it accepts.

5.5 Tree module

Classes

- class `covanode< scalar_type_ >`
Class that defines nodes of a covatree.
- class `covatree< scalar_type_ >`
Class that defines a covatree for search tree approximated local polynomial regression.

5.5.1 Detailed Description

The Tree module of covafill provides a class for search tree approximated local polynomial regression.

```
#include <covafill/Interpolate>
```

6 Class Documentation

6.1 `atomicEvalFill< Type >` Class Template Reference

CppAD atomic class to use estimated derivatives in automatic differentiation. See `CppAD::atomic_base` for further documentation.

Inheritance diagram for `atomicEvalFill< Type >`:

Collaboration diagram for `atomicEvalFill< Type >`:

Public Member Functions

- `atomicEvalFill` (const char *name, `covafill< AD< Type > > cf_`)
Constructs class to evaluate atomic function.

6.1.1 Detailed Description

```
template<class Type>class atomicEvalFill< Type >
```

CppAD atomic class to use estimated derivatives in automatic differentiation. See `CppAD::atomic_base` for further documentation.

The documentation for this class was generated from the following file:

- `atomic.hpp`

6.2 `atomicEvalTree< Type >` Class Template Reference

CppAD atomic class to use estimated derivatives in automatic differentiation. See `CppAD::atomic_base` for further documentation.

Inheritance diagram for `atomicEvalTree< Type >`:

Collaboration diagram for `atomicEvalTree< Type >`:

Public Member Functions

- `atomicEvalTree` (`const char *name`, `covtree< AD< Type > > ct_`)
Constructs class to evaluate atomic function.

6.2.1 Detailed Description

```
template<class Type>class atomicEvalTree< Type >
```

CppAD atomic class to use estimated derivatives in automatic differentiation. See `CppAD::atomic_base` for further documentation.

The documentation for this class was generated from the following file:

- atomic_Tree.hpp

6.3 bicubicInterpolation< scalar_type_ > Class Template Reference

Class for bi-cubic interpolation of local polynomial regression on a square.

Inheritance diagram for bicubicInterpolation< scalar_type_ >:

Collaboration diagram for bicubicInterpolation< scalar_type_ >:

Public Member Functions

- **bicubicInterpolation** (covafill< scalar_type > *cf, vectortype minCoord, vectortype maxCoord)
*Constructs a **bicubicInterpolation** class from a covafill class cf, an boundaries of the interpolation square defined by the minimum coordinates, minCoord, and maximum coordinates, maxCoord, in each dimension, e.g., minCoord = (0,0) and maxCoord = (1,1).*
- virtual vectortype **operator()** (vectortype newcoord)
Calculates the interpolation prediction at newcoord.

Additional Inherited Members

6.3.1 Detailed Description

```
template<typename scalar_type_>class bicubicInterpolation< scalar_type_>
```

Class for bi-cubic interpolation of local polynomial regression on a square.

The documentation for this class was generated from the following file:

- bicubicInterpolation.hpp

6.4 covafill< scalar_type_> Class Template Reference

Class to do local polynomial regression.

Public Member Functions

- `covafill` (const `covafill`< scalar_type_ > &x)
Constructs a covafill class from another covafill class x.
- `covafill` (matrix_type coordinates_, vector_type observations_)
Constructs a covafill class with coordinates matrix coordinates_, observation vector observations, bandwidths 1, and polynomial degree 2.
- `covafill` (matrix_type coordinates_, vector_type observations_, scalar_type h_, int p_)
Constructs a covafill class with coordinates matrix coordinates_, observation vector observations, bandwidths h_, and polynomial degree p_.
- `covafill` (matrix_type coordinates_, vector_type observations_, vector_type h_, int p_)
Constructs a covafill class with coordinates matrix coordinates_, observation vector observations, bandwidths h_, and polynomial degree p_.
- int `getDim` () const
- void `setH` (scalar_type h_)
- void `setH` (vector_type h_)
- vector_type `operator()` (vector_type x0, bool returnAll=false) const
Calculates the local polynomial regression estimate at x0. If returnAll is false, then only the function and first derivative estimates are returned. Otherwise all estimates are returned.
- vector_type `operator()` (vector_type x0, scalar_type excludeRadius, bool returnAll=false) const
Calculates the local polynomial regression estimate at x0. All observations with coordinates x such that $\|x - x_0\| > r$, where r is excludeRadius. If returnAll is false, then only the function and first derivative estimates are returned. Otherwise all estimates are returned.
- `covafill`< scalar_type > & `operator=` (const `covafill`< scalar_type > &rhs)
Assignment operator for covafill.

Public Attributes

- matrix_type `coordinates`
- vector_type `observations`
- int `p`
- vector_type `h`

6.4.1 Detailed Description

```
template<typename scalar_type_>class covafill< scalar_type_>
```

Class to do local polynomial regression.

6.4.2 Member Function Documentation

6.4.2.1 `template<typename scalar_type_> int covafill< scalar_type_>::getDim () const`

Returns the covariate dimension.

6.4.2.2 `template<typename scalar_type_> void covafill< scalar_type_>::setH (scalar_type h_)`

Sets all bandwidths to h_.

Referenced by `covafill< scalar_type_>::covafill()`.

6.4.2.3 `template<typename scalar_type_> void covafill< scalar_type_>::setH (vector_type h_)`

Sets the bandwidths from a vector. The length of h_ must match the covariate dimension.

6.4.3 Member Data Documentation

6.4.3.1 `template<typename scalar_type_> matrix_type covafill< scalar_type_>::coordinates`

Coordinates/covariates of input.

Referenced by `covafill< scalar_type_>::covafill()`, and `covafill< scalar_type_>::operator=()`.

6.4.3.2 `template<typename scalar_type_> vector_type covafill< scalar_type_>::h`

Vector of (positive) bandwidths - one for each covariate.

Referenced by `covafill< scalar_type_>::operator=()`.

6.4.3.3 `template<typename scalar_type_> vector_type covafill< scalar_type_>::observations`

Input observations.

Referenced by `covafill< scalar_type_>::operator=()`.

6.4.3.4 `template<typename scalar_type_> int covafill< scalar_type_>::p`

Polynomial degree.

Referenced by `covafill< scalar_type_>::operator=()`.

The documentation for this class was generated from the following files:

- covafill.hpp
- covafill_constructors.hpp
- covafill_operators.hpp
- covafill_privateFunctions.hpp
- covafill_publicFunctions.hpp

6.5 jags::covafillJAGS::covafillJAGS Class Reference

Class that defines the covafill function for local polynomial regression to be used in a JAGS model.

Inheritance diagram for `jags::covafillJAGS::covafillJAGS`:

Collaboration diagram for `jags::covafillJAGS::covafillJAGS`:

Public Member Functions

- [covafillJAGS](#) ()
Default constructor.
- void [evaluate](#) (double *value, std::vector< double const * > const &args, std::vector< std::vector< unsigned int > > const &dims) const
Evaluates a covafill object.
- std::vector< unsigned int > [dim](#) (std::vector< std::vector< unsigned int > > const &dims, std::vector< double const * > const &values) const
Returns dimension of result.
- bool [checkParameterDim](#) (std::vector< std::vector< unsigned int > > const &dims) const
Function to check parameter dimensions. Currently returns true for any input dimension.

6.5.1 Detailed Description

Class that defines the covafill function for local polynomial regression to be used in a JAGS model.

The documentation for this class was generated from the following files:

- covafillJAGS.hpp
- covafillJAGS.cpp

6.6 jags::covafillJAGS::covafillModule Class Reference

Class that defines a JAGS Module for local polynomial regression.

Inheritance diagram for jags::covafillJAGS::covafillModule:

Collaboration diagram for jags::covafillJAGS::covafillModule:

6.6.1 Detailed Description

Class that defines a JAGS Module for local polynomial regression.

The documentation for this class was generated from the following file:

- covafill.cpp

6.7 covanode< scalar_type_ > Class Template Reference

Class that defines nodes of a covatree.

Public Member Functions

- [covanode](#) (matrixtype coordSplit, scalar_type minSplitSize_, [covafill](#)< scalar_type > *cf, vectortype minCoords, vectortype maxCoords)

Constructs a node in a covatree.

- int `getDim` ()

Get coordinate dimension.

- vectortype `operator()` (vectortype newcoord)

Returns the interpolated value at newcoord of the local polynomial regressions at the corners of the boundary box.

6.7.1 Detailed Description

```
template<typename scalar_type_>class covanode< scalar_type_ >
```

Class that defines nodes of a covatree.

6.7.2 Constructor & Destructor Documentation

6.7.2.1 `template<typename scalar_type_ > covanode< scalar_type_ >::covanode (matrixtype coordSplit, scalar_type minSplitSize_, covafill< scalar_type > * cf, vectortype minCoords, vectortype maxCoords)`

Constructs a node in a covatree.

Parameters

<i>coordSplit</i>	The remaining coordinates in the split at which we are now creating a note
<i>minSplitSize_</i>	The minimum number of coordinates at which the node will create a subtree.
<i>cf</i>	A covafill object for local polynomial regression at the corners of the boundary box.
<i>minCoords</i>	Minimum coordinates of the boundary box corners, e.g., (0,0) in two dimensions.
<i>maxCoords</i>	Maximum coordinates of the boundary box corners, e.g., (1,1) in two dimensions.

The documentation for this class was generated from the following files:

- covanode.hpp
- covanode_constructors.hpp
- covanode_operators.hpp

6.8 covatree< scalar_type_ > Class Template Reference

Class that defines a covatree for search tree approximated local polynomial regression.

Public Member Functions

- `covatree` (scalar_type minSplitSize_, covafill< scalar_type > *cf)

Constructs a tree from a covafill object cf with minimum number of coordinates at which a sub tree will be created minSplitSize_.

- int `getDim` ()

Get coordinate dimension.

- vectortype `operator()` (vectortype newcoord) const

Returns the interpolated value at newcoord of the local polynomial regressions at the corners of the boundary box.

6.8.1 Detailed Description

```
template<typename scalar_type_>class covatree< scalar_type_ >
```

Class that defines a covatree for search tree approximated local polynomial regression.

The documentation for this class was generated from the following files:

- covatree.hpp
- covatree_constructors.hpp

6.9 cubicInterpolation< scalar_type_ > Class Template Reference

Class for cubic interpolation in dimension 1-3 of local polynomial regression on a square.

Public Member Functions

- [cubicInterpolation](#) (covafill< scalar_type_ > *cf, vectortype minCoords, vectortype maxCoords)
Constructs a [bicubicInterpolation](#) class from a covafill class cf, an boundaries of the interpolation square defined by the minimum coordinates, minCoord, and maximum coordinates, maxCoord, in each dimension, e.g., minCoord = (0,0) and maxCoord = (1,1).
- vectortype [operator\(\)](#) (vectortype newcoord)
Returns the interpolation prediction at newcoord.

6.9.1 Detailed Description

```
template<typename scalar_type_>class cubicInterpolation< scalar_type_ >
```

Class for cubic interpolation in dimension 1-3 of local polynomial regression on a square.

The documentation for this class was generated from the following file:

- cubicInterpolation.hpp

6.10 ncubicInterpolation< scalar_type_ > Class Template Reference

Class for n-cubic interpolation (n = 1,2,3) of local polynomial regression on a square. The class should not be used as anything but a common parent for the dimension specific interpolation classes.

Inheritance diagram for ncubicInterpolation< scalar_type_ >:

Public Member Functions

- `ncubicInterpolation` (`covafill`< `scalartype` > *`cf`, `vectortype` `minCoord_`, `vectortype` `maxCoord_`)
Constructs a `ncubicInterpolation` class from a `covafill` class `cf`, an boundaries of the interpolation square defined by the minimum coordinates, `minCoord`, and maximum coordinates, `maxCoord`, in each dimension, e.g., `minCoord = (0,0)` and `maxCoord = (1,1)`.
- virtual `vectortype` `operator()` (`vectortype` `newcoord`)=0
Calculates the interpolation prediction at `newcoord`.

Protected Member Functions

- `ncubicInterpolation` (`vectortype` `minCoord_`, `vectortype` `maxCoord_`)
Constructor from coordinates. Should in general not be called.

Protected Attributes

- int `dim`
- `vectortype` `minCoord`
- `vectortype` `maxCoord`

6.10.1 Detailed Description

```
template<typename scalartype_>class ncubicInterpolation< scalartype_ >
```

Class for n-cubic interpolation (n = 1,2,3) of local polynomial regression on a square. The class should not be used as anything but a common parent for the dimension specific interpolation classes.

6.10.2 Member Data Documentation

6.10.2.1 `template<typename scalartype_> int ncubicInterpolation< scalartype_ >::dim` [protected]

Dimension of coordinates, i.e., the n in n-cubic.

6.10.2.2 `template<typename scalartype_> vectortype ncubicInterpolation< scalartype_ >::maxCoord` [protected]

maximum coordinates of boundary box.

6.10.2.3 `template<typename scalartype_> vectortype ncubicInterpolation< scalartype_ >::minCoord` [protected]

Minimum coordinates of boundary box.

The documentation for this class was generated from the following file:

- `ncubicInterpolation.hpp`

6.11 `tricubicInterpolation< scalartype_ >` Class Template Reference

Class for tri-cubic interpolation of local polynomial regression on a square.

Inheritance diagram for tricubicInterpolation< scalar_type_ >:

Collaboration diagram for tricubicInterpolation< scalar_type_ >:

Public Member Functions

- [tricubicInterpolation](#) ([covafill](#)< scalar_type > *cf, vectortype [minCoord](#), vectortype [maxCoord](#))
Constructs a [tricubicInterpolation](#) class from a covafill class cf, an boundaries of the interpolation square defined by the minimum coordinates, minCoord, and maximum coordinates, maxCoord, in each dimension, e.g., minCoord = (0,0,0) and maxCoord = (1,1,1).
- virtual vectortype [operator\(\)](#) (vectortype newcoord)
Calculates the interpolation prediction at newcoord.

Additional Inherited Members

6.11.1 Detailed Description

```
template<typename scalar_type_>class tricubicInterpolation< scalar_type_ >
```

Class for tri-cubic interpolation of local polynomial regression on a square.

The documentation for this class was generated from the following file:

- tricubicInterpolation.hpp

6.12 unicubicInterpolation< scalar_type_ > Class Template Reference

Class for cubic interpolation of local polynomial regression on a square.

Inheritance diagram for unicubicInterpolation< scalar_type_ >:

Collaboration diagram for unicubicInterpolation< scalar_type_ >:
